The main objective of the scientific conference is to create space for presentation of current results of scientific work and discussion of scientific information and practical experience between leading scientists of the Russian Federation and other countries in the field of social brain research.

The purpose of the conference is to draw the public's attention to the impressive topic of "The Social Brain". During the two years of the pandemic, we have gained invaluable experience in communicating remotely, revised and reformatted communication preferences, and began to treat new digital opportunities and communication channels differently. At the same time, cognitive distortions began to appear more and more often in relations between members of society. The spectrum of the social world is quite wide, from the most intimate types of relationships to community, education or work, and even broader social issues, each of which requires the management of spontaneous social interactions and social self-determination.

It is important to show the versatility of social interactions and the relevance of studying human behavior in decision making, emotions, formation of social interactions. scientific research from different countries - fundamental research, research in the psycho-emotional and emotional-volitional sphere, behavioral economics and the psychology of decision-making, art historians and sociologists.

During the conference, various aspects of neurochemistry and neurobiology of the brain will be observed to identify processes associated with individual interactions, emotional intelligence, the formation of individual areas, regulation of response to interpersonal stressors. The issues of researching communication and social distancing, taking into account social networks in the field of development of neurochemistry and psychology, will also be touched upon.
